# *Description*

The **hiring process** is a crucial function of any company, and **understanding trends such as the number of rejections, interviews, job types, and vacancies can provide valuable insights for the hiring department.**

In this project, I will be provided a dataset containing records of previous hires. Our job is to **analyze this data** and answer certain questions that can help the company improve its hiring process.

Here's what I will be going:

1. **Handling Missing Data:** Check if there are any missing values in the dataset. If there are, decide on the best strategy to handle them.
2. **Clubbing Columns:** If there are columns with multiple categories that can be combined, do so to simplify your analysis.
3. **Outlier Detection:** Check for outliers in the dataset that may skew your analysis.
4. **Removing Outliers:** Decide on the best strategy to handle outliers. This could be removing them, replacing them, or leaving them as is, depending on the situation.
5. **Data Summary:** After cleaning and preparing your data, summarize your findings. This could involve calculating averages, medians, or other statistical measures. It could also involve creating visualizations to better understand the data.

# *Approach*

To perform the required tasks and complete the project, I have used Microsoft Excel.

I have used the excel average function for calculating the average.

I have also used the concept of pivot tables for the different distributions, group selection for class intervals, charts for better visualizations.

## Hyperlink to the excel

\* Please open the presentation and excel sheet in Microsoft software as opening in Google is changing the layout and plots \*

## Tech Stack Used

## Result

**A. Hiring Analysis:** The hiring process involves bringing new individuals into the organization for various roles.

**Task:** Determine the gender distribution of hires. How many males and females have been hired by the company?

**B. Salary Analysis:** The average salary is calculated by adding up the salaries of a group of employees and then dividing the total by the number of employees.

**Your Task:** What is the average salary offered by this company? Use Excel functions to calculate this.

	<b>TASK B</b>	
	<b>Average Salary Offered</b>	
	49983.02902	

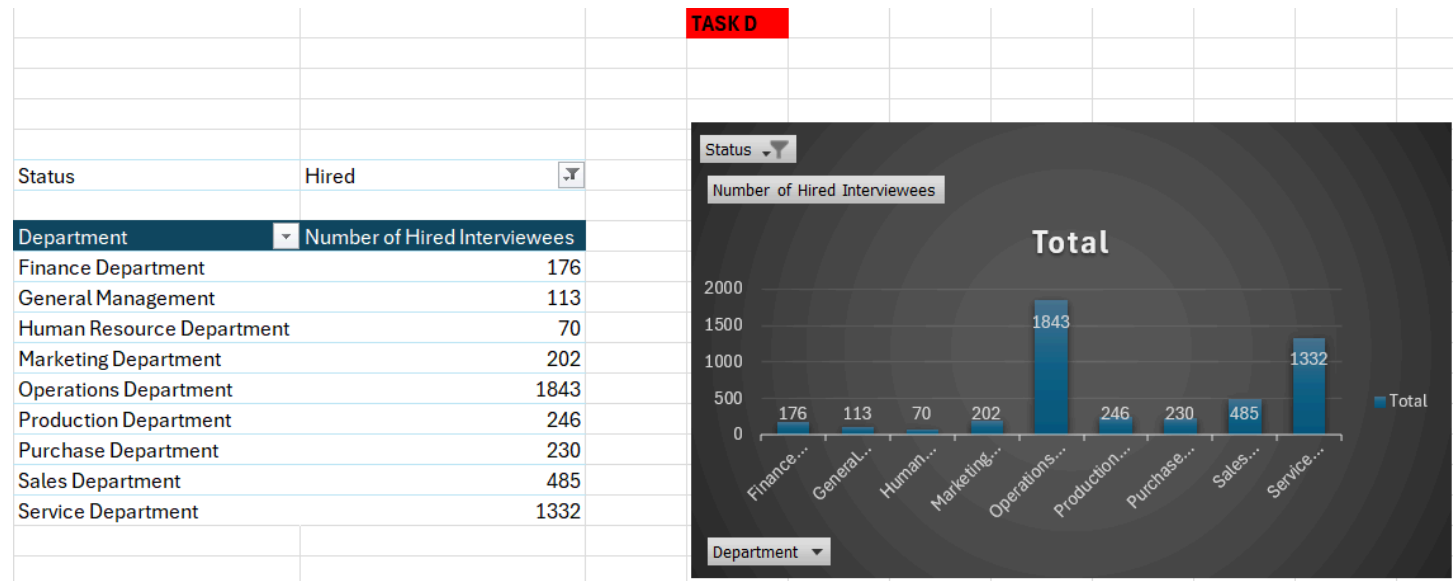

**C. Salary Distribution:** Class intervals represent ranges of values, in this case, salary ranges. The class interval is the difference between the upper and lower limits of a class.

**Your Task:** Create class intervals for the salaries in the company. This will help you understand the salary distribution.

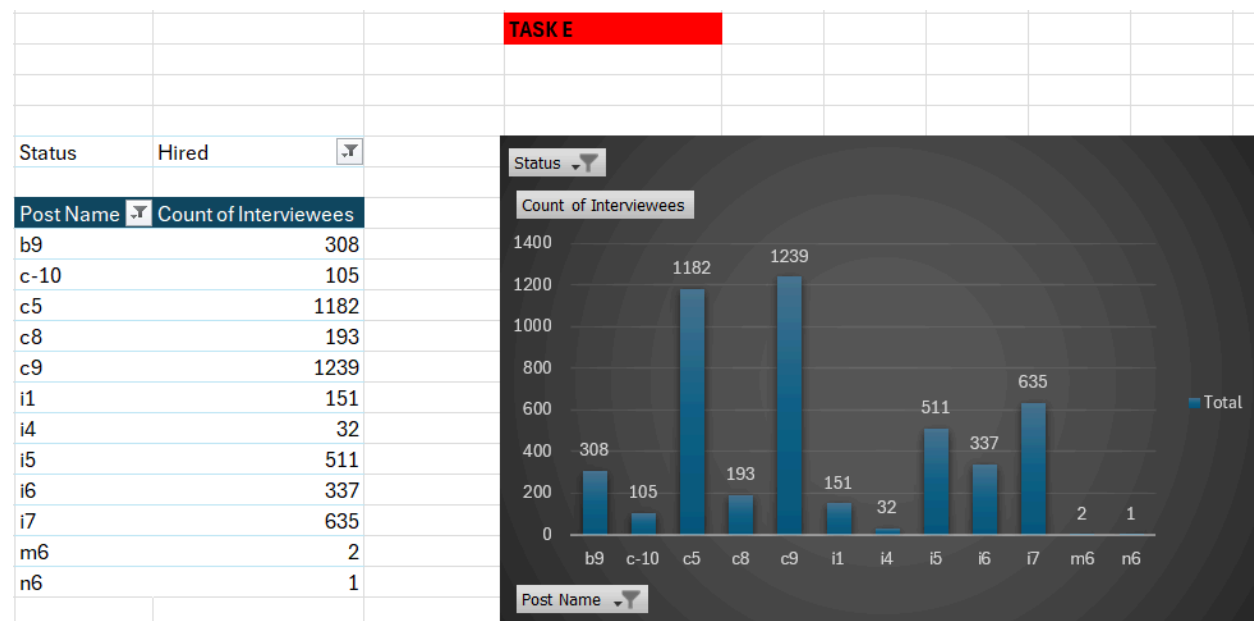

**D. Departmental Analysis:** Visualizing data through charts and plots is a crucial part of data analysis.

**Your Task:** Use a pie chart, bar graph, or any other suitable visualization to show the proportion of people working in different departments.

**E. Position Tier Analysis:** Different positions within a company often have different tiers or levels.

**Your Task:** Use a chart or graph to represent the different position tiers within the company. This will help you understand the distribution of positions across different tiers.

# *Insights*

- *The average salary offered by the company is 49983.03*
- *Male and female hired employees are 2563 & 1856 respectively.*
- *Maximum number of employees fall in the salary range of 50k to 60k.*
- *The Operations department has the highest number of employees hired.*
- *C9 post has the highest number of employees.*
